

VENTRICULAR PACING FOR PREVENTION OF ATRIAL FIBRILLATION

Abstract

5

A method and apparatus for preventing atrial fibrillation arising from a premature atrial contraction. Upon detection of a premature atrial contraction, a pace is delivered to a ventricle at a specified AV interval selected as either a late-pace or early-pace value. The resulting ventricular depolarization then occurs during a time when the
10 atria are not vulnerable to the triggering of fibrillation.
